NuFTA 2.0: New Templates and an Automatic Generator

of Fault tree for NuSCR

Junik Son, Yonghyun Kim, Kukbin Jeong, Dong-Ah Lee, Junbeom Yoo

Division of Computer Science and Engineering, Konkuk University

NuFTA 2.0

◎ A CASE tool for software fault tree analysis

O Automatically generate fault tree, logic formula and minimal cut-sets using NuSCR

NuSCR : Formal specfication Language for NPPs

NuSCR

A formal software requirements specification method of KNICS(Korea Nuclear Instrumentation and Control System) **RPS(Reactor Protection System)**

③ 3 Variable model

- Function variable node (SDT)
- : mathematical functional behavior of a system
- History variable node (FSM)
- : state-based behavior of a system

- **O** Introduce the concept of set and change the template
- **O** Performs backward analysis using a fault that expert defined

Software Fault Tree Analysis

New Templates for NuFTA - FSM

- Timed history variable node (TTS) : timed-related behavior of a system

Expansion of FSM and TTS

- **©** FSM and TTS have states whose output value selected by previous state's output value and ingoing transition's assignment
- It's difficult to analyze one state's total output value
- ◎ Solution : Annotated FSM and TTS

- One state has all previous state's names, an ingoing condition, all outgoing conditions and output value - Reordered transitions which present new states relation

O Action statements is able to be causes when output of other variable node is appeared in an output of a current variable node

- **O** The previous version of the template for FSM and TTS generates duplicate conditions in a tree
- **O** Solution : Change the template

- Add an action statement in the new version of the template
- In the case of "Enter the state via state transition" in FSM or TTS, condition statements are modified when an assignment of state is related to value of input.
- In the case of "Remain at the state because of disabled outgoing transition" in FSM or TTS, the output value of the action statement is a value which was a previous cycle output value of current Node.

New Templates for NuFTA - SDT

Automatic SFTA from NuSCR

◎ NuFTA 2.0 reads XML files written in NuSCR and automatically draws the fault tree according to an expert-defined fault.

Automatically generated SFT

Generated Output of NuFTA 2.0

Cut-sets

Abstract fault tree

© Generate fault tree and formula using fault that user defined

- **O** Generate abstract fault tree
 - This is composed of logic gate and variable node which is related to the fault that user defined

nausten x = Mel (Hem (20)) (1,0) (20) (HESS (He (20)) (1,0) (HESS (He (20)) (H

Subtree

© Generate subtree

© Generate cut-sets using fault tree and formula

NuFTA 1.0 NuFTA 2.0 1759915 916140 1012 738 Length of formul (Byte) Drawing tims (ms) **Comparison of performance**

O We prosed a CASE tool which automatically generates fault tree, logical formula and minimal cutsets from NuSCR to assistance Fault Tree Analysis

O We improved fault tree drawing time and length of formula compared to the previous version

O We will study how to extract minimal cut-sets and analyze time constrains in TTS for analysis of multiple cycles.
